DAY-22

PAGE NO.:
DATE:

Inferential statistics:

Estimation:

- point Estimation
- Interval Estimation

→ Estimation is a process of drawing conclusion for population based on sample data.

→ (i) population parameter
→ (ii) sample statistics

(i) properties of the populati i.e. mean, varied (σ^2), std (σ) etc

(ii) it is same as populati parameter but it explain their "estimation".

Mean for
- (i) population mean (μ) (entire)
- (ii) sample statistics ($\bar{x}$)

PAGE NO.:
DATE:

(#) point Estimation :-

it is process of giving a "single best value" for unknown population parameter.

(*) properties :-

(·) consistent :-

larger the sample size (↑) more accurate estimate (↑)

(·) Unbiased :-

(i) MLE (max likelihood estimate)
(ii) Laplace estimate.
(iii) Wilson estimate
(iv) Jeffrey estimate

(*) Drawback :-

(·) problem of Reliability or NOT enough evidence

(#) Interval estimate :-

it count the interval.

ie (a, b)

PAGE NO.:
DATE:

- provide intervals, in which population parameters falls.
- more accurate than point estimation
